

Monitoring of tropical forest changes using remote sensing techniques toward REDD and sustainable forest management

Yasumasa Hirata
Shikoku Research Center, FFPRI

REDD

Reducing Emissions from Deforestation
in Developing countries

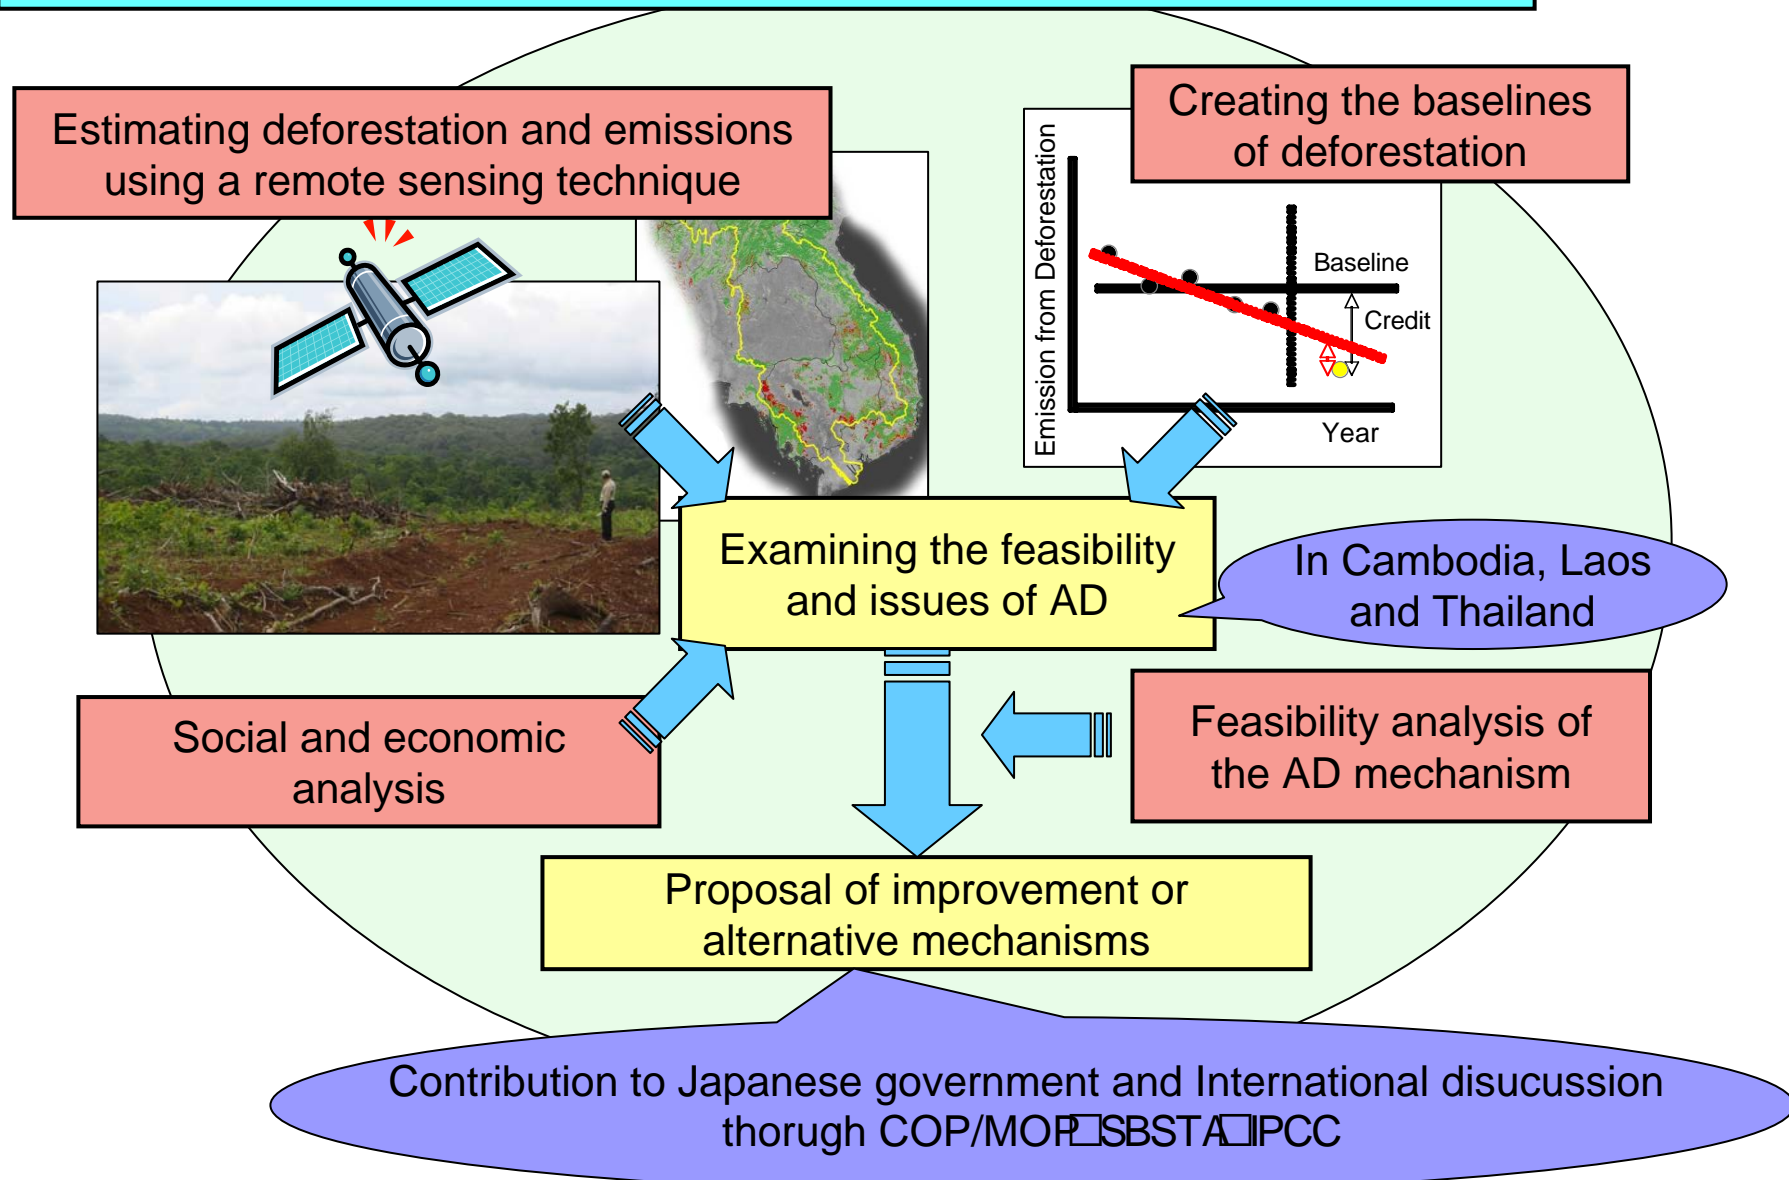

- New challenge toward next framework -

Outline

- Introduction of our feasible study on REDD in Southeast Asian countries
- Monitoring of deforestation and degradation using Remote Sensing
- Monitoring of illegal logging
- Monitoring of shifting cultivation
- Capability of remote sensing for monitoring and SFM

Research on the feasibility to estimate the GHG emissions reduction through Avoiding Deforestation

Study Fields

■ Thailand

- Deforestation happened already

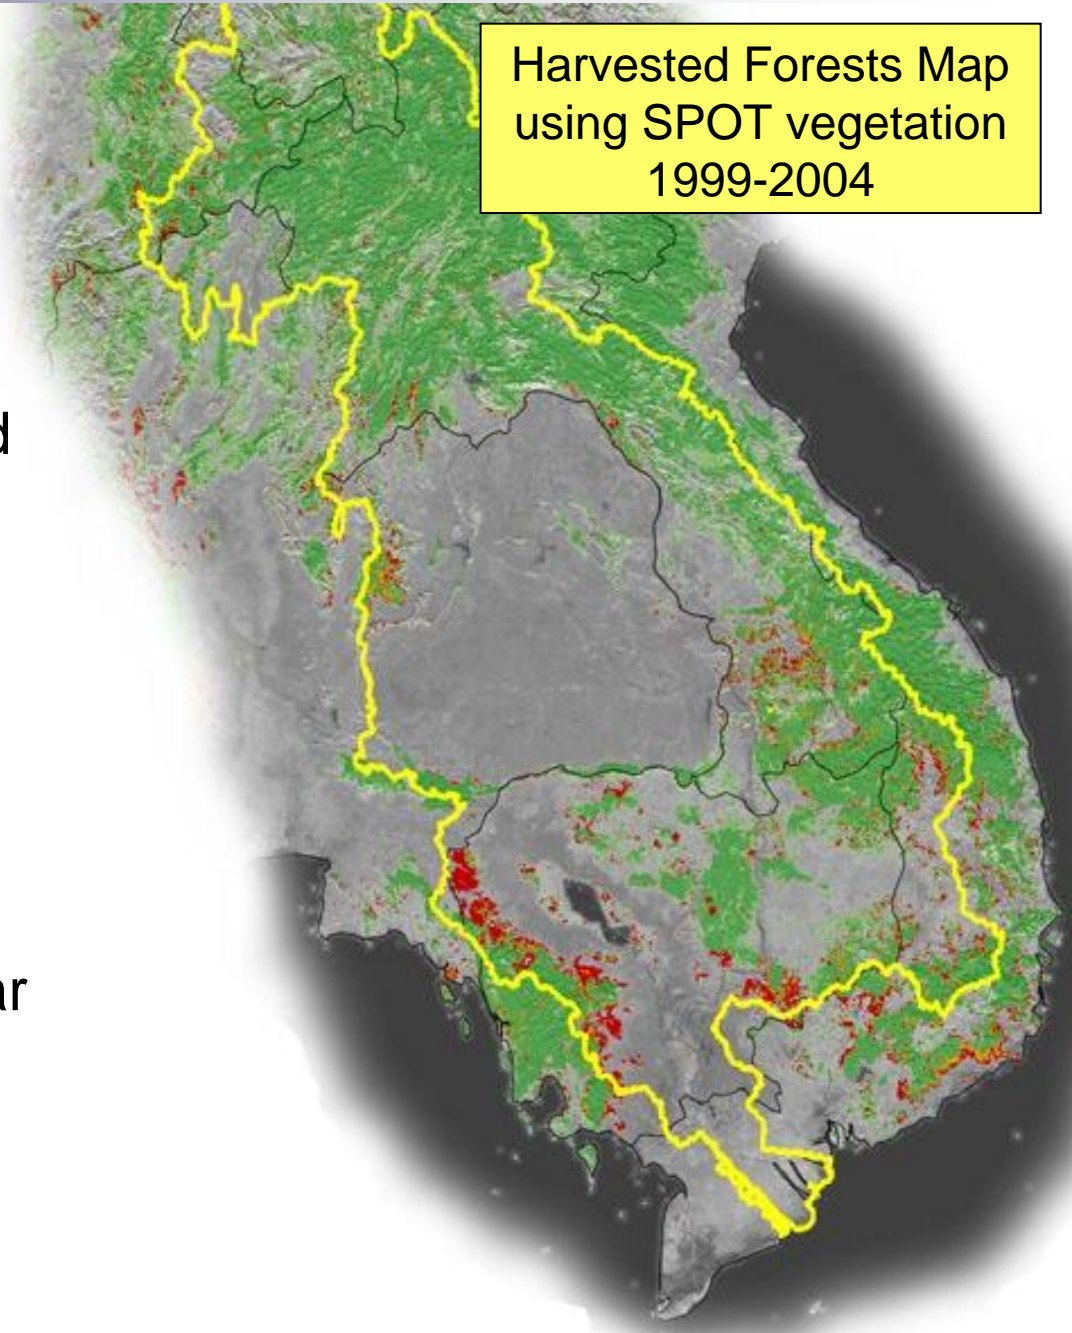

■ Cambodia

- On-going deforestation

■ Laos

- Deforestation in the near future

Harvested Forests Map
using SPOT vegetation
1999-2004

Key Points of the Project

■ Mekong basin countries

- Different scale and process of deforestation from Indonesia and Brazil
- Each country has different stages of deforestation

■ Remote sensing techniques

- Integration of several sensors including ALOS, MODIS, TM, IKONOS

■ Reference scenarios

- Trial of socio-economics models

■ Degradation

- Combination of remote sensing and ground survey

■ Socio-economics approaches

- Process of deforestation and degradation
- Design and Governance

Scheme of Detecting Deforestation and Degradation

Deforestation

Hot spot mapping

Year X (beginning)

eg. TM, ASTER, AVNIR-2

November

Sampling

Degradation / Deforestation

eg. QB, PRISM

Interpretation

1. land-use change
2. No of canopy
3. Canopy diameter

Modeling

Volume estimation for trees and stands

Comparison

Degradation index

Classification

Smoothing < 1ha

Comparison

Smoothing < 1ha

Classification

Phenology phase correction

Year Y (End)

November

February

February

Methodology development

1. Change detection using mid-resolution images
 - * Phenology phase
 2. Hot spot detection
 3. Sampling design
-
4. Interpretation design
 - * Interpretation keys
 5. Designing degradation index

Detection of “Deforestation” using Remote Sensing

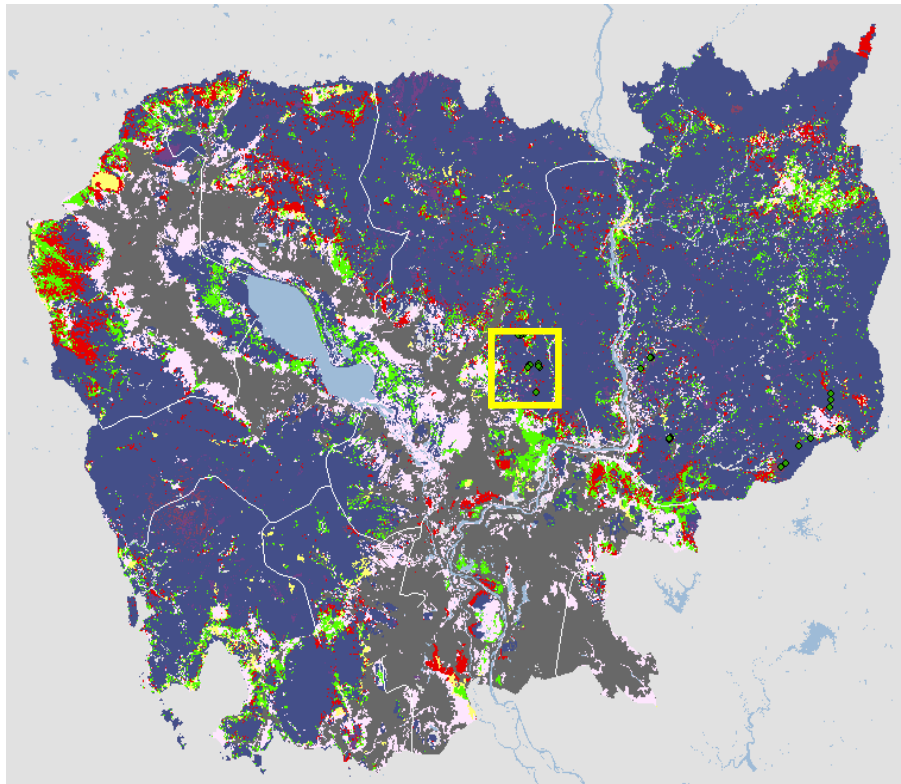

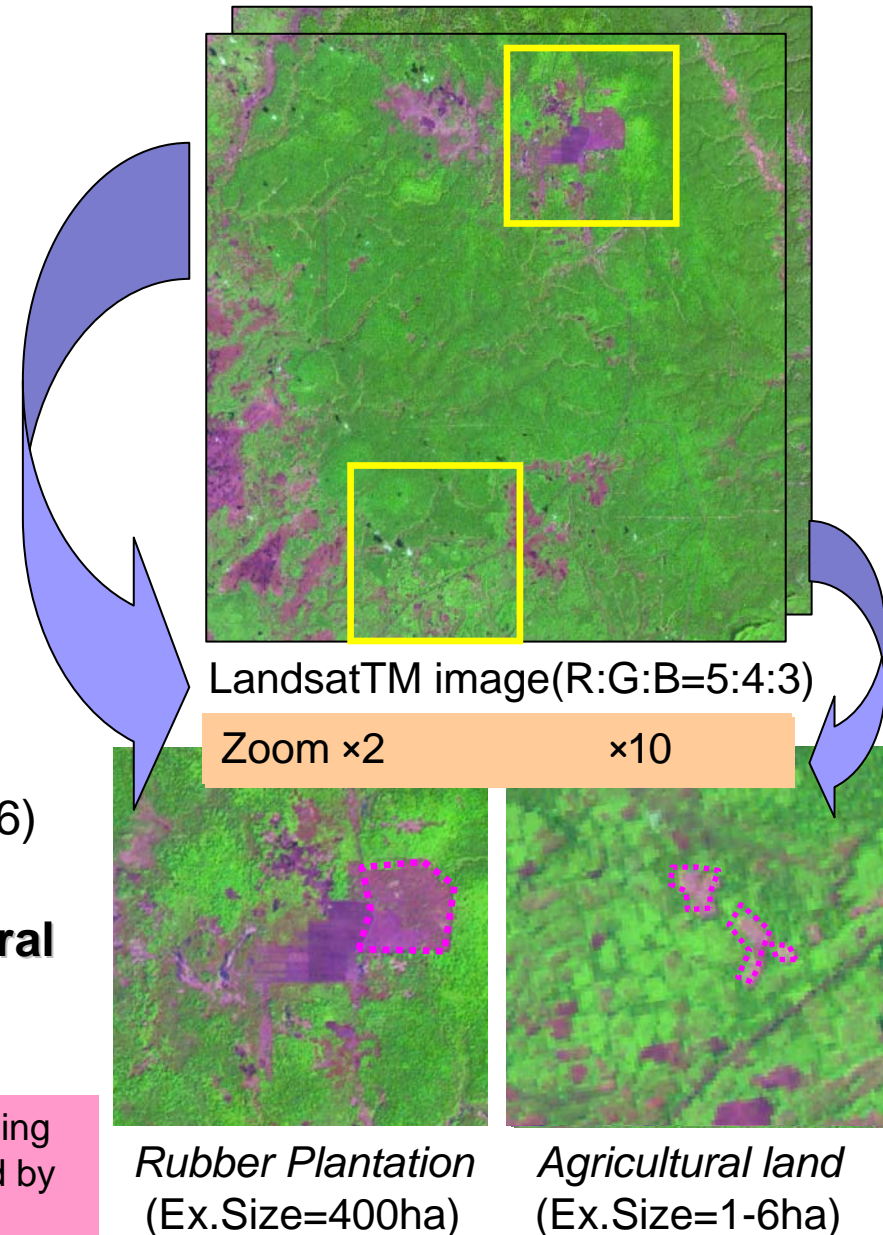

Fig. Deforestation in Cambodia (1993-2006)

—Clarifying the deforestation that can be stably detected using the mid-resolution imagery. *Deforestation* could be caused by a variety of background and with a variety of scale.

Detection of “Degradation” using Remote Sensing

Fig. Degradation by Selective Cutting

Selective logging is common in the commercial operations. Logging roads and the traces of harvesting along the roads are visible in the high resolution imagery.

Year 1993 (Aerial photo)

Year 2001 (Aerial photo)

Fig. relationship between Crown size and tree biomass

–Making *Degradation Index* using visual interpretation of the high resolution imagery

Site of illegal logging in Cambodia

Patterns of deforestation in Cambodia

- Conversion to farmland development by small-scale farmers(1-5 ha)
- Large-scale development by concession (rubber plantation, acasia plantation?)(10-1000 ha)

Shifting cultivation in northern Laos

2km

Remote area (whole mountain or overall slope (30-100 ha))

Shortening of rotation and enlargement of cultivation area

Conversion to rubber plantation after shifting cultivation

Urban forest area (ownership is clear and patch distribution, 0.5-1.5 ha)

Monitoring of shifting cultivation by ASTER images

2002/2/9

2005/2/1

2003/3/16

2006/3/8

Image pre-processing

Object-oriented classification

6 years - shifting cultivation
distribution map

Monitoring of shifting cultivation
for six years

Field survey for validation of remote sensing results in Cambodia

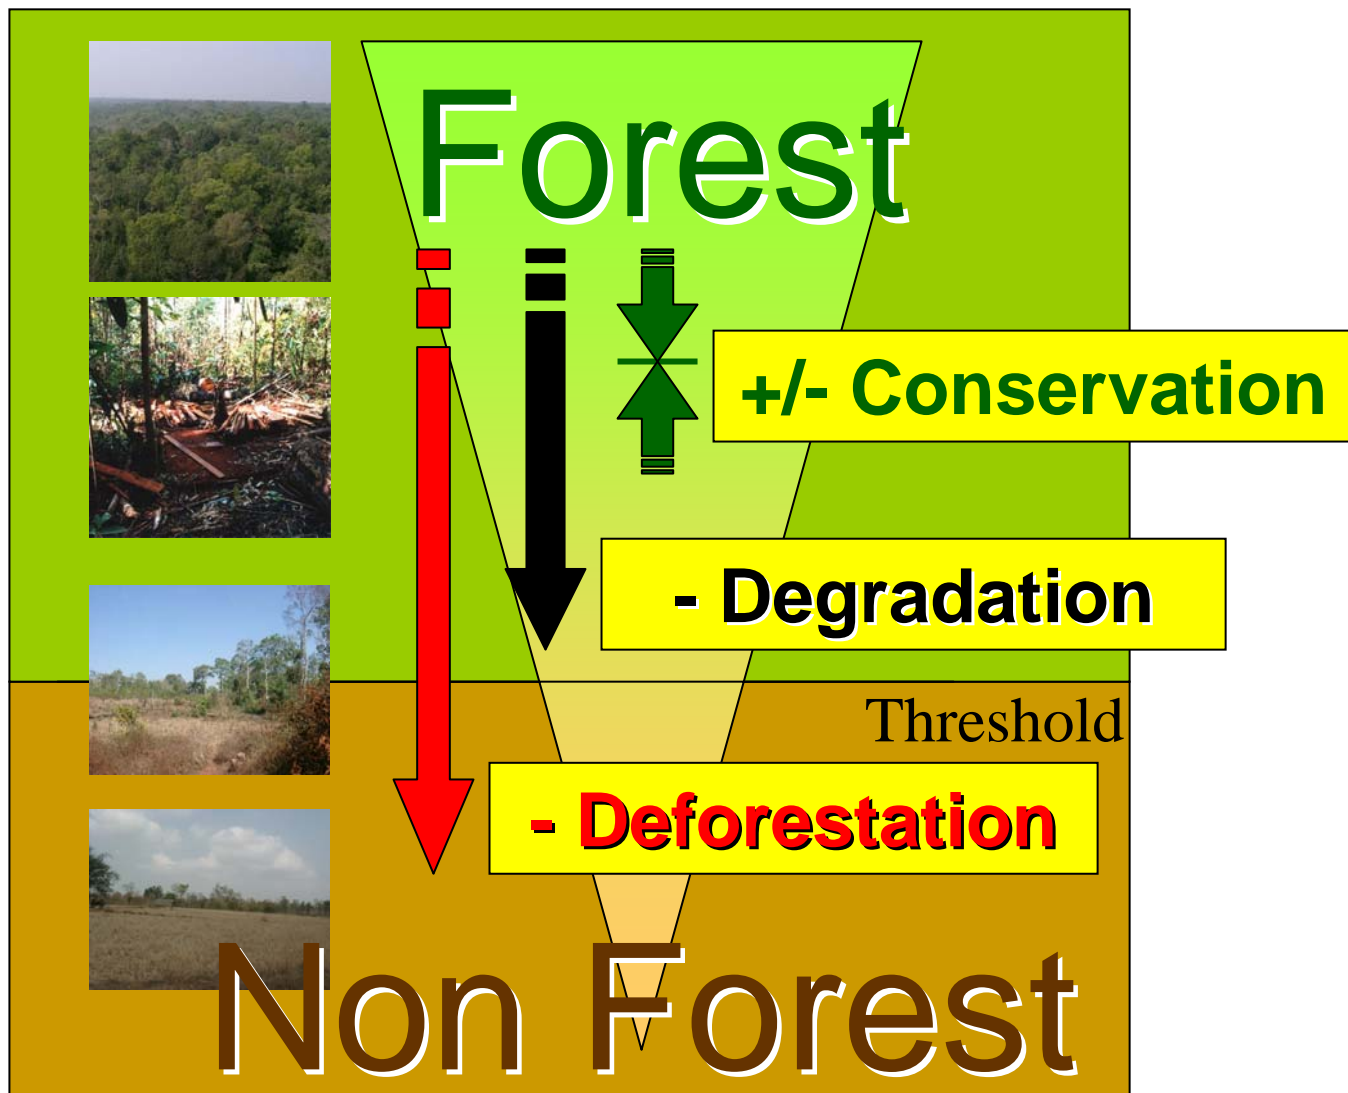

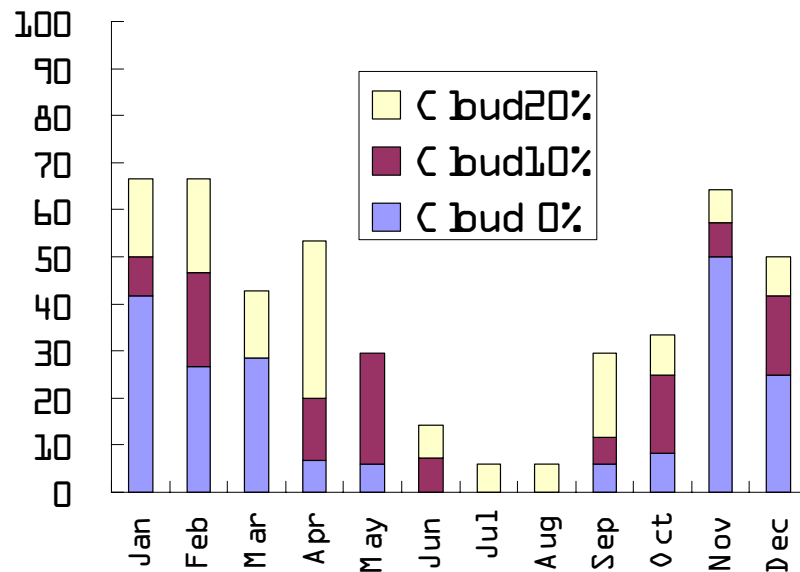

Capability of remote sensing for monitoring and SFM

- Different definitions and difference between land use and land cover
- Limit of data acquisition of optical sensor
- Possibility and limit of SAR data
- Selection of method for change detection

Definitions of forest, non forest, conservation, degradation and deforestation

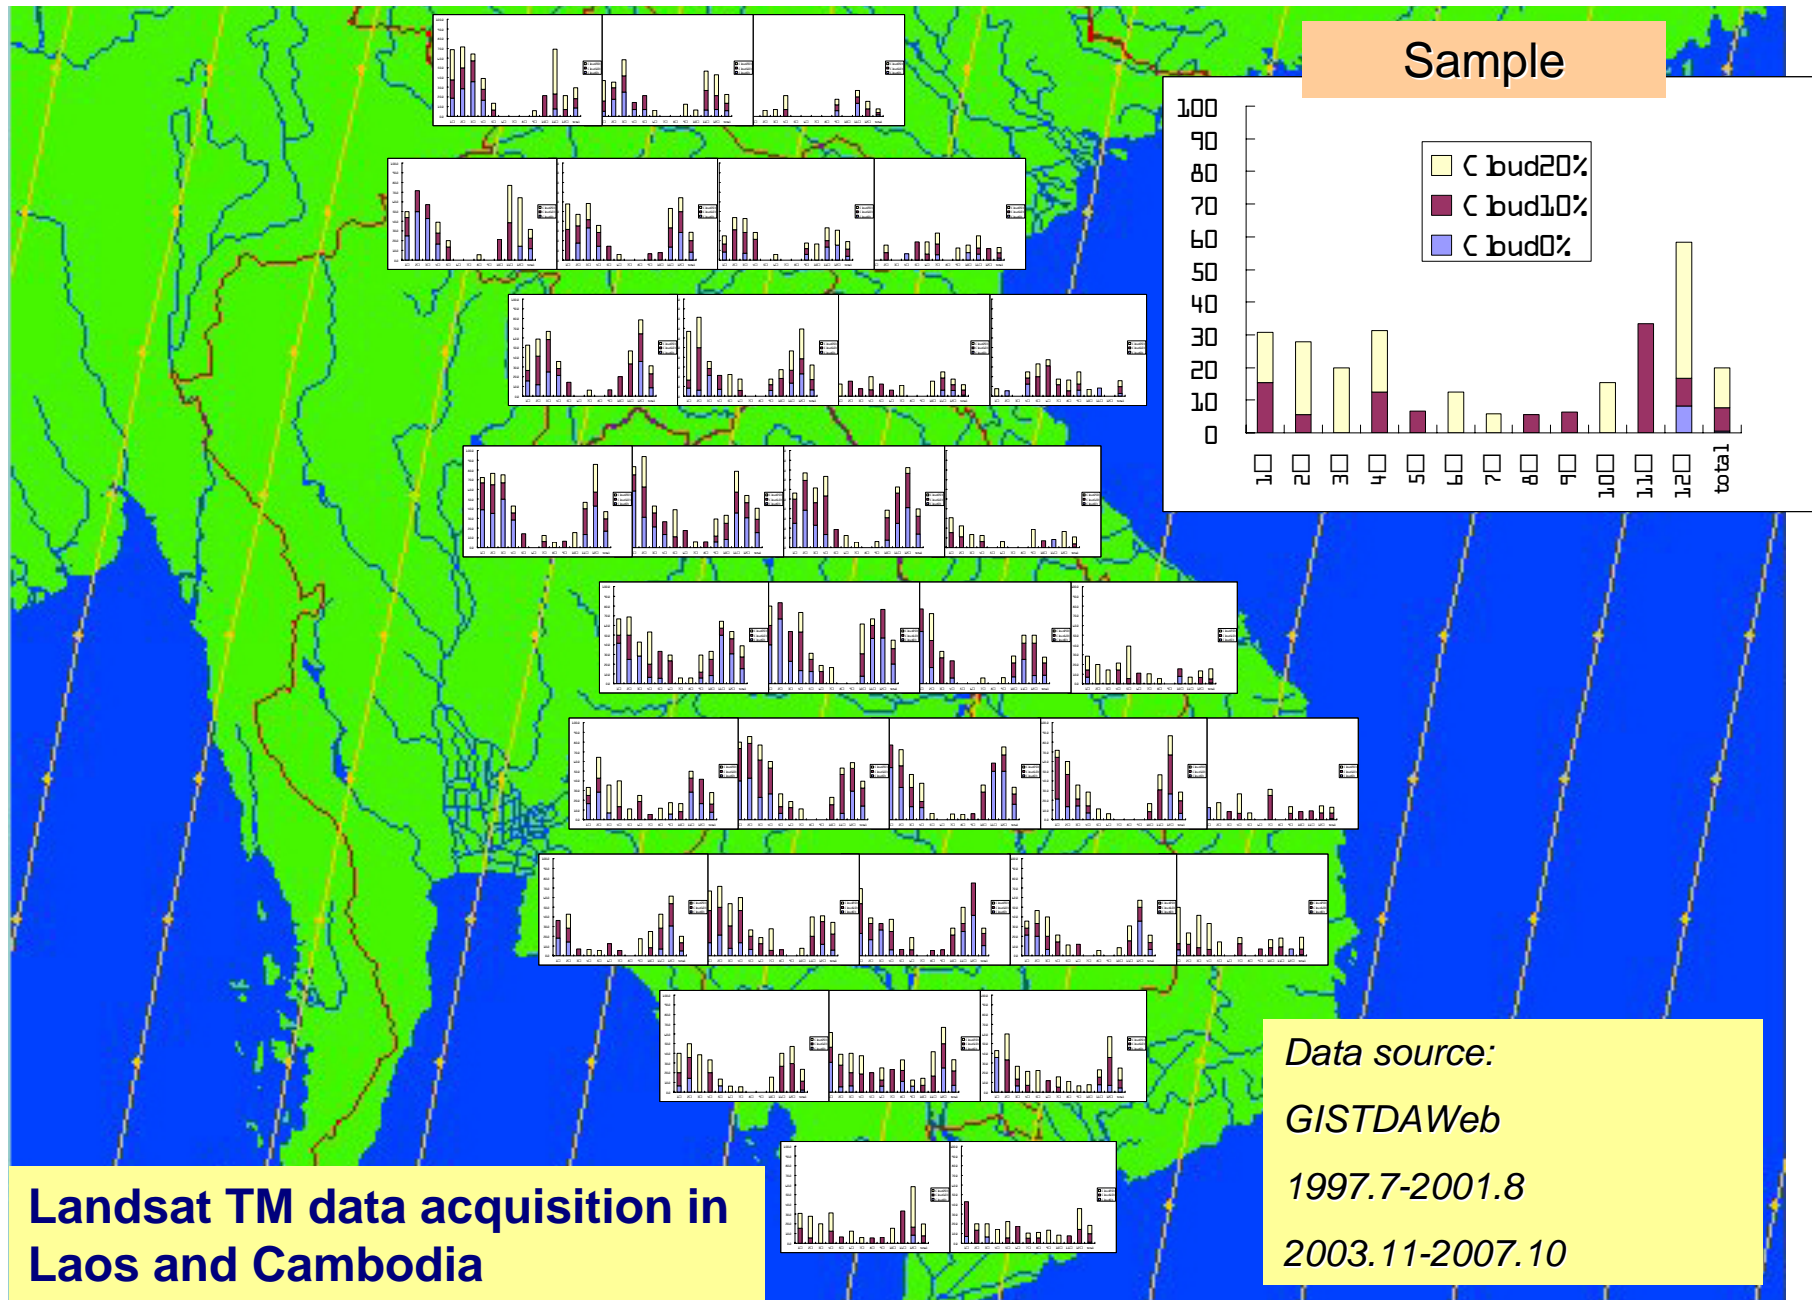

Cloud cover in optical sensor

Rate of Acquisition

$$= \frac{\text{Frequency of certain cloud cover}}{\text{Frequency of data acquisition}}$$

Locality and seasonality of data acquisition

Landsat TM data acquisition in Borneo Island

Data source:
GISTDAWeb
1997.7-2001.8
2003.11-2007.10

Change detection in Amazon using SAR images

Amazon mosaic(Rondonia area)

JERS (Sep/Dec, 1995, pixel spacing=100m)

PALSAR (2006, pixel spacing=50m)

Mode : FBS41.5[deg]
Polarization : HH
Map projection : Mercator

Topography of Southeast Asia from Space Shuttle (SRTM-3)

Comparison of methods for change detection

Method	Advantage	Fault	Accuracy
Difference	Simple and good result	Change of land cover types is not identified	High
PCA using two scenes	Cutting are and plantations appear in certain PC	Results are influenced by seasonal changes of vegetation and land cover	Medium
Change Vector Analysis	Properties of changes are clarified	Analysis of change vectors is complicated	Medium
Comparison between classification results	Land cover types are clarified	Accuracy of classification is different between two scenes	Low

Remarks

- Monitoring with remote sensing has **advantages** and **limits** for various types of deforestation.
 - Forest fire, shifting cultivation,... ?
- The difficulty of creating baseline from complicated factors of deforestation
 - How to simplify it or other ideas?
- It is very **important** how to **act** after monitoring of deforestation.
 - Strategy, requirements....

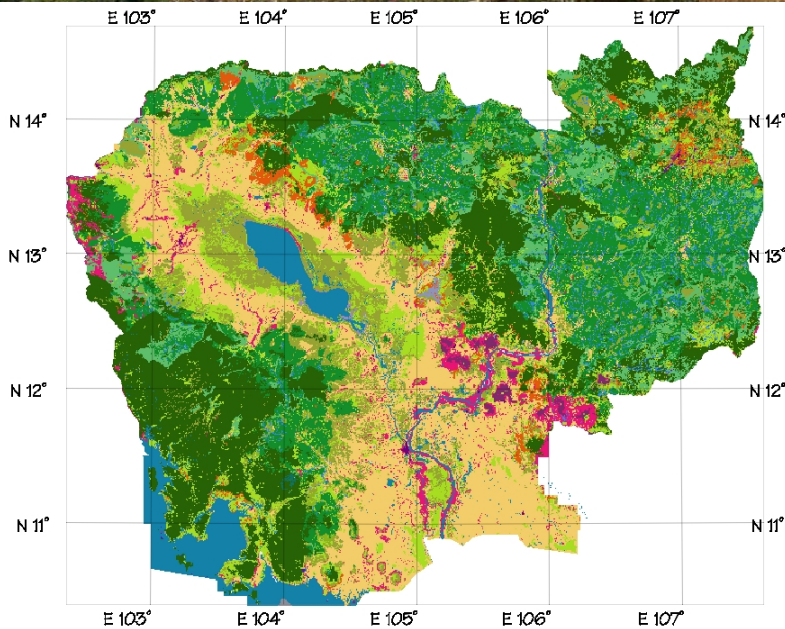

Evergreen forest

Mixed forest

Deciduous forest

Any questions?
